

VPC Comparison Tool — Quickstart

Version 1.0.0

Run the tool (30 seconds)

- 1. Clone or open this project folder.
- 2. Open **index.html** in Chrome, Safari, or Edge (desktop).
 - Double-click the file, or
 - From the project folder: `python3 -m http.server 8080` then visit `http://localhost:8080/`
- 3. In each of the **three columns**, choose a product from the dropdown.
- 4. Compare spec rows side by side. Pick **Select a product ▼** again to clear a column.

No install, no build, no database.

Using the UI

Action	Result
Choose a product	That column fills with spec values; dropdown shows Vendor — Product in bold; vendor logo appears below the dropdown
Choose Select a product ▼	Column clears (empty cells, no TBD); logo hides
Same product in two columns	Allowed
HDT product selected	ⓘ appears beside the vendor logo; click for connector/shelter note
Product marked with *	This product is included in the Vendor Product Catalog but was not independently tested by UC Davis. A footnote appears below the table when selected.
Missing data in source	TBD pill in that cell
Connector + bed capacity blank	N/A for bed capacity

Update product data

File: `data.js` only.

Example — change a value

Find the product id under specs, then the spec key:

```
"dlx-x24": {  
  wind: "65 mph sustained, 75 mph gusts",  
  // ...  
}
```

Use null for unknown values (shows **TBD**).

Example — add a product

1. Under the vendor in vendors, add to products:
`{ id: "dlx-new", name: "New Model", type: "shelter" }`
2. Under specs, add "dlx-new": { bedCapacity: null, extDims: null, ... } with every key from specRows.
3. Refresh the browser.

Example — add a vendor

1. Add a vendor object to vendors with name, logo, and products:
`{ name: "Acme", logo: "logos/acme.png", products: [...] }`
2. Drop the logo image (PNG recommended) into the logos/ folder using the exact filename referenced above.
3. Add spec entries under specs for each new product id.
4. Refresh the browser.

Labels for rows are in specRows (e.g. ground → "Recommended ground surface").

What not to edit for routine updates

- app.js — behavior (dropdowns, TBD/N/A rules, HDT popover, logo wiring)
 - index.html / styles.css — layout and look
 - logos/ — vendor logo images; add files here when adding a new vendor, otherwise leave as-is
 - Reference Material/ — local source docs; not loaded by the app
-
